To Whom It May Concern,

It is my pleasure to recommend Michael Flaig, who worked as a backend developer on our developer tooling project at webeet.io.

Michael's most significant contribution was one that benefited every engineer on the team, often invisibly: he designed and implemented our CI pipeline. This infrastructure automatically validates new code, catches regressions early, and helps maintain stability as the project evolves. It is foundational work that is easy to overlook but critical to the long-term health of any engineering organization. Michael took ownership of it early and executed it exceptionally well.

Beyond infrastructure, Michael approached his own development as an engineer with notable discipline and maturity. During the project, he adopted test-driven development practices for the first time and applied them consistently rather than superficially. He also demonstrated a thoughtful approach to AI-assisted development tools, using them to accelerate his workflow while maintaining a strong understanding of the systems and code he was building. That balance between efficiency and technical ownership is rare and valuable.

One area that particularly stood out was his commitment to code quality. Michael independently developed and refined a detailed AI-assisted code review workflow, using a carefully structured prompt to evaluate his work before every submission. The quality of that process was evident in the results: over time, his code became increasingly polished, his pull requests were consistently well-organized, and many potential issues or edge cases had already been identified and addressed before review. His contributions became some of the easiest and most reliable for the team to evaluate and integrate.

What I valued most, however, was Michael's attitude toward growth. He consistently embraced unfamiliar tools, methodologies, and workflows with genuine curiosity and initiative. He did not wait to be directed or pushed; he actively sought opportunities to improve and followed through with real effort. In my experience, that combination of initiative, adaptability, and willingness to learn is one of the strongest indicators of long-term success in software engineering.

I recommend Michael with confidence for any role that will allow him to continue growing as an engineer. I am confident he will bring the same level of thoughtfulness, reliability, and continuous improvement to future teams and projects.
